07/07/2025 - Office Visit

Provider: Abdallah S Farrukh MD

Location of Care: Antelope Valley Neuroscience Medical Group

History of Present Illness:

So saw the patient today he carried a diagnosis of pseudotumor cerebri he said he seen Dr. Salah the but have not communication from the patient visit with us orotidine. Path

The patient also does not have a schedule examination with the ophthalmologist said he is 6 he is patient comes and I have no data from his ophthalmologist I have no data from Salina Dean undulated shared this with his insurance to advance the value of Myanmar so which when we see a patient I dictated with the patient and this is a communication to dead air will enhance and improve on patient care down the line and the patient can be able to read the mind of the physician at the time he dictates or he sees the patient

For me the patient arm blood pressure when he came in his normal systolic 120 his visual field to confrontation within normal limit the patient does not report any change in his with his vision PFF He seems to understand that he needs close follow-up peeler

As far as her concern today his exam is normal the patient has a negative Romberg, he did well with upper appendicular cerebellar activity in his cranial examination is normal Salome repeat and my recommendations

The patient will need a spinal tap to check his intracranial pressure
I like him to see ophthalmology for funduscopy and visual field confrontation every 6 months like him to check with Dr. Salah had Dean every 6 months. Path

Active Medications:

Topamax 50 mg tablet (topiramate) Take 1 tablet by mouth twice a day as directed WK1: 1 PO QD WK2
AND ON: 1 PO BID
