

**DAMON GHEE**

Male DOB: 05/15/1956

99830

Ins: Medicare Southern Region

**06/17/2025 - Office Visit: INITIAL CONSULT**

**Provider: Manprit K Dhillon MD**

**Location of Care: Antelope Valley Neuroscience Medical Group**

**History of Present Illness:**

I saw DAMON GHEE in the office today for an initial consultation. He is a 69 year old man with the complaint of low back pain involving the bilateral buttocks and posterior thighs in the morning. He describes the leg pain as aching and weakness. He underwent a hemorrhoidectomy and had developed right-sided low back pain after the procedure which has decreased. He denies any numbness or tingling of the legs or any bowel or bladder incontinence. He is able to walk up to 3-1/2 miles which takes him an hour. His best position is sitting and worst position is standing.

He has not undergone physical therapy but does home exercises without relief of the low back pain. He has not been to the chiropractor or had injections done. He takes Motrin.

He takes Motrin 800 mg when necessary.

His MRI of the lumbar spine done at AVAI on March 21 reveals moderate L2-3 and L3-4 discogenic disease. There is moderate to severe stenosis at L3-4 with minimal CSF seen around the cauda equina. There is right L4-5 lateral recess narrowing and diffuse lower lumbar facet joint disease.
